EDXSO Assignment 2: Claude Automation

Weekly Workflow, Limitations & Human Review

Prepared by: Abhi Pandey

1. Weekly Workflow

1. **Collect:** Copy meeting notes into Claude, using only fictional or anonymised information.
2. **Generate:** Use a reusable prompt to create an action tracker, follow-up drafts, a founder brief, and process-gap analysis.
3. **Verify:** Compare outputs with the original notes. Flag missing owners, dates, and amounts as “TBD” instead of guessing.
4. **Track:** Transfer verified actions to Google Sheets or Excel, with owners, deadlines, priorities, categories, and statuses.
5. **Follow up:** Send approved messages, update progress after confirmation, and review open or overdue tasks at the next founders’ meeting.

2. Limitations

Claude can misunderstand rough notes, misinterpret deadlines, or generate unsupported details. It cannot independently confirm payments, task completion, vendor responses, or legal compliance. AI-generated outputs must therefore be checked before use.

3. Human-Review Checks

- Verify every task, date, amount, owner, and deadline against the original notes.
- Obtain approval before sending external messages or committing company resources.
- Have an appropriate human reviewer confirm DPDP compliance before expanding a pilot.
- Never enter real student, parent, or teacher personal data into an AI tool.
- Mark tasks complete only after confirmation from the responsible owner.

4. Tools Used and Manual Checks

Tools: Claude for drafting and extraction; Google Sheets/Excel for tracking; Google Docs for documentation.

I manually checked the outputs against the fictional meeting notes, verified the stated dates and ₹40,000 budget cap, and flagged missing information rather than inventing facts.

Principle: AI speeds up routine work; humans remain responsible for decisions, approvals.
